Register Number:722819106033

Build a python code, Assume u get temperature and humidity values (generated with random function to a variable) and write a condition to continuously detect alarm in case of high temperature.

Code:

```
import random
import time
while True:
    Temperature=random.randint(0,100)
    Humidity=random.randint(0,100)
    if(Temperature>40):
        print("TEMPERATURE=",Temperature)
        print("HUMIDITY=",Humidity)
        print("!!HIGH TEMPERATURE!!")
        print("ALARM IS ON")
        print('\n')
    else:
        print("TEMPERATURE=",Temperature)
        print("HUMIDITY=",Humidity)
```

Execution Screenshot:

The screenshot displays a Python script on the left and its execution output in a terminal window on the right. The script generates random temperature and humidity values. When the temperature is greater than 40, it prints the current values, a high temperature warning, and turns the alarm on. Otherwise, it prints the values and a normal temperature status. The terminal output shows several iterations of these values, with the alarm being triggered multiple times.

```

import random
import time
while True:
    Temperature=random.randint(0,100)
    Humidity=random.randint(0,100)
    if(Temperature>40):
        print("TEMPERATURE=",Temperature)
        print("HUMIDITY=",Humidity)
        print("!!HIGH TEMPERATURE!!")
        print("ALARM IS ON")
        print('\n')
    else:
        print("TEMPERATURE=",Temperature)
        print("HUMIDITY=",Humidity)
        print("NORMAL TEMPERATURE",'\n')
    time.sleep(5)
```
